Featured Projects:

Packaging Design 1, Term 5

Cadillac Celestiq Pre-Order Package

Developed a bespoke unboxing experience for the Cadillac Celestiq by conducting persona research to transform a standard product delivery into a physical expression of ownership. I engineered a multi-layered system of custom-molded items and personalized artifacts, managing the full process from 3D modeling to physical fabrication.

Designing for HAY, Term 5

HAY Home/Office Set

Collaborated with a peer to design and manufacture a cohesive product family tailored to HAY's brand identity, focusing on enhancing the home office experience through a timer, pencil holder, and lamp. The project involved the full technical lifecycle, from initial brand strategy to producing detailed manufacturing documentation and working prototypes.

3D Modeling 3, Term 5

EV SuperBike

Developed a fully detailed EV motorcycle focusing on complex surfacing and realistic mechanical integration from initial ideation to high-fidelity 3D rendering. The project showcased a refined ability to translate technical internal components into a cohesive, aerodynamic form suitable for a performance-oriented brand identity.

Product Design 4, Term 4

Dyson Personal Climate Device

Designed a personal desktop climate control device for Dyson that utilizes targeted airflow to optimize individual comfort in shared workspaces. I managed the full design cycle from researching environmental stressors to developing 3D models and CMF strategies that align with Dyson's premium engineering identity.

Product Design 3, Term 3

AmaVida Water Harvester

Designed a self-sufficient water-harvesting system for Indigenous Amazonian communities that combines rainfall collection with atmospheric water generation. The project prioritizes off-grid functionality and culturally sensitive form, addressing water scarcity through passive energy systems and gravity filtration.
